## CHAPTER S3 – EQUILIBRIUM

# Assigned readings

---

3/1 Introduction

3/2 System isolation and the free-body diagram

3/3 Equilibrium conditions (2-D)

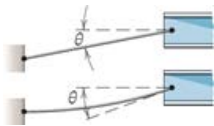

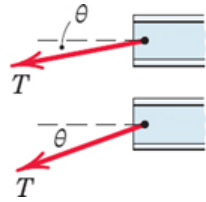

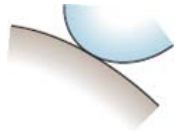

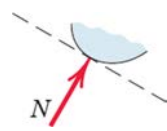

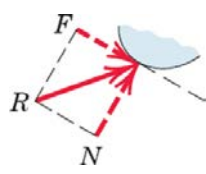

# 3/1 Introduction

---

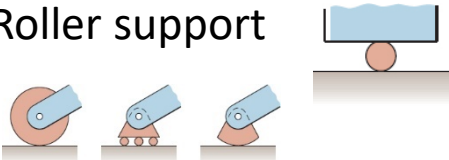

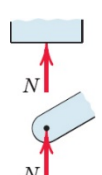

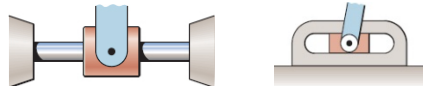

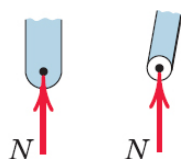

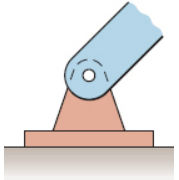

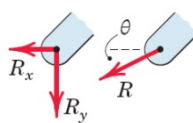

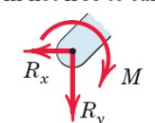

Equilibrium conditions:

These conditions are said to be **necessary** and **sufficient** to maintain equilibrium

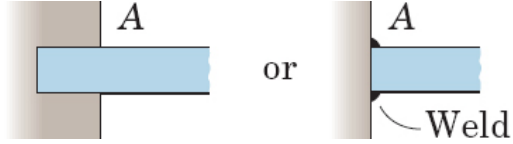

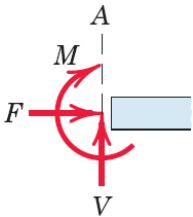

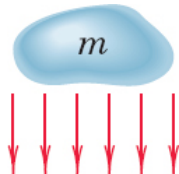

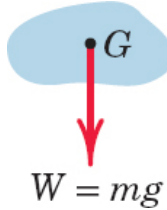

# 3/2 System isolation & free-body diagrams

Type of Contact and Force Origin	Action on Body to Be Isolated
<p>1. Flexible cable, belt, chain, or rope</p> <p>Weight of cable negligible</p> <p>Weight of cable not negligible</p> 	 <p>Force exerted by a flexible cable is always a tension away from the body in the direction of the cable.</p>
<p>2. Smooth surfaces</p> 	 <p>Contact force is compressive and is normal to the surface.</p>
<p>3. Rough surfaces</p> 	 <p>Rough surfaces are capable of supporting a tangential component <math>F</math> (frictional force) as well as a normal component <math>N</math> of the resultant contact force <math>R</math>.</p>

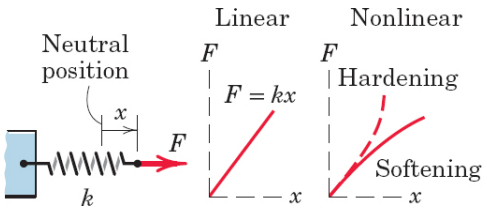

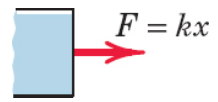

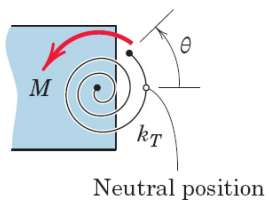

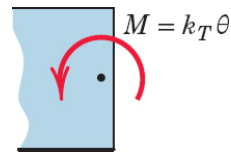

# 3/2 System isolation & free-body diagrams

Type of Contact and Force Origin	Action on Body to Be Isolated
<p>4. Roller support</p> 	 <p>Roller, rocker, or ball support transmits a compressive force normal to the supporting surface.</p>
<p>5. Freely sliding guide</p> 	 <p>Collar or slider free to move along smooth guides; can support force normal to guide only.</p>
<p>6. Pin connection</p> 	<p>Pin free to turn</p>  <p>Pin not free to turn</p>  <p>A freely hinged pin connection is capable of supporting a force in any direction in the plane normal to the pin axis. We may either show two components <math>R_x</math> and <math>R_y</math> or a magnitude <math>R</math> and direction <math>\theta</math>. A pin not free to turn also supports a couple <math>M</math>.</p>

# 3/2 System isolation & free-body diagrams

Type of Contact and Force Origin	Action on Body to Be Isolated
<p>7. Built-in or fixed support</p> 	 <p>A built-in or fixed support is capable of supporting an axial force <math>F</math>, a transverse force <math>V</math> (shear force), and a couple <math>M</math> (bending moment) to prevent rotation.</p>
<p>8. Gravitational attraction</p> 	 <p>The resultant of gravitational attraction on all elements of a body of mass <math>m</math> is the weight <math>W = mg</math> and acts toward the center of the earth through the center of gravity <math>G</math>.</p>

# 3/2 System isolation & free-body diagrams

Type of Contact and Force Origin	Action on Body to Be Isolated
<p><b>9. Spring action</b></p>  <p>The diagram shows a spring with stiffness <math>k</math> attached to a wall on the left and a body on the right. A force <math>F</math> is applied to the body to the right, causing a displacement <math>x</math> from the neutral position. To the right, two graphs of Force <math>F</math> versus displacement <math>x</math> are shown. The first is a straight line labeled 'Linear' with the equation <math>F = kx</math>. The second is a curve labeled 'Nonlinear' with two branches: 'Hardening' (increasing slope) and 'Softening' (decreasing slope).</p>	 <p>A free-body diagram of a rectangular body with a red arrow pointing to the right, labeled <math>F = kx</math>.</p> <p>Spring force is tensile if the spring is stretched and compressive if compressed. For a linearly elastic spring the stiffness <math>k</math> is the force required to deform the spring a unit distance.</p>
<p><b>10. Torsional spring action</b></p>  <p>The diagram shows a torsional spring with stiffness <math>k_T</math> attached to a wall on the left and a body on the right. A moment <math>M</math> is applied to the body, causing an angular deflection <math>\theta</math> from the neutral position. To the right, a free-body diagram shows a rectangular body with a red curved arrow representing the moment <math>M</math>.</p>	 <p>A free-body diagram of a rectangular body with a red curved arrow representing a moment <math>M = k_T \theta</math>.</p> <p>For a linear torsional spring, the applied moment <math>M</math> is proportional to the angular deflection <math>\theta</math> from the neutral position. The stiffness <math>k_T</math> is the moment required to deform the spring one radian.</p>

# 3/2 System isolation & free-body diagrams

---

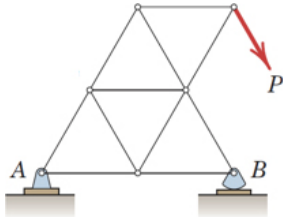

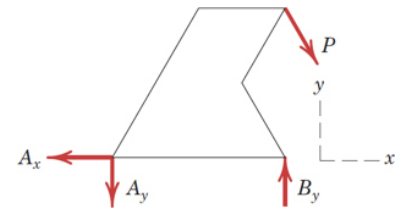

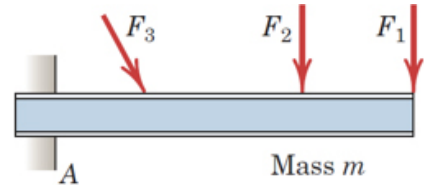

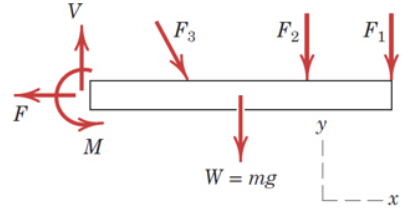

Most important step in solving mechanics problems!

Isolate the system including external boundaries

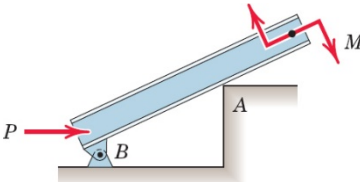

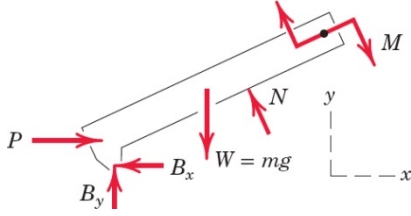

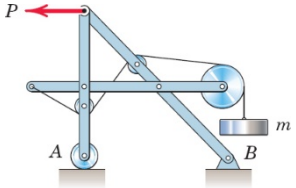

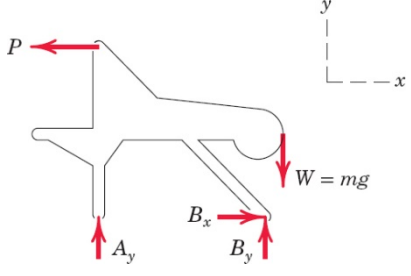

Identify **ALL** forces which act on the isolated system and represent them in the diagram

# 3/2 System isolation & free-body diagrams

Mechanical System	Free-Body Diagram of Isolated Body
<p>1. Plane truss</p> <p>Weight of truss assumed negligible compared with <math>P</math></p> 	
<p>2. Cantilever beam</p> 	

# 3/2 System isolation & free-body diagrams

Mechanical System	Free-Body Diagram of Isolated Body
<p>4. Beam Smooth surface contact at A. Mass <math>m</math></p> 	
<p>4. Rigid system of interconnected bodies analyzed as a single unit Weight of mechanism neglected</p> 	

# 3/3 Equilibrium conditions

---

Scalar format:

$$\sum F_x = 0$$

$$\sum F_y = 0$$

$$\sum M_o = 0$$

# 3/3 Equilibrium conditions

---

Alternative equilibrium equations:

$$\sum F_x = 0$$

$$\sum M_A = 0$$

$$\sum M_A = 0$$

$$\sum M_B = 0$$

$$\sum M_B = 0$$

$$\sum M_C = 0$$

# 3/3 Equilibrium conditions

---

Two-force members occur when a body is in equilibrium under the action of only two forces

These forces must be **equal**, **opposite**, **collinear**, and independent of the object shape

# 3/3 Equilibrium conditions

---

Three-force members occur when a body is in equilibrium under the action of only three forces

These forces must be **concurrent**, except in cases where all three forces are parallel

(a) Three-force member

(b) Closed polygon satisfies  $\Sigma \mathbf{F} = \mathbf{0}$

# 3/3 Equilibrium conditions

Statically determinant system

Rigid system of interconnected bodies  
analyzed as a single unit

# 3/3 Equilibrium conditions

---

Adequacy of constraints

# 3/3 Equilibrium conditions

---

Adequacy of constraints

# Sample problem 3/1

---

Determine the magnitudes of the forces **C** and **T**, which, along with the other three forces shown, act on the bridge-truss joint.

# Sample problem 3/4

Determine the magnitude  $T$  of the tension in the supporting cable and the magnitude of the force on the pin at  $A$  for the jib crane shown. The beam  $AB$  is a standard 0.5-m I-beam with a mass of 95 kg per meter of length.
